

Group 6 is proud to present

ClarifAI

Making medical notes clear for patients.

Bridging the Comprehension Gap

The Problem

Medical language in clinical notes is completely inaccessible for the average patient. Consequently, doctors are forced to constantly adjust their language, leading to communication gaps and anxiety.

Our Solution

An autonomous "**ClarifAI it for me**" button integrated directly into the patient portal. ClarifAI acts as an instant translator for complex medical language.

Users

Any patient, that wants to read their medical note, but doesn't understand the "doctors language"

Data

Input: Clinical notes in the patient portal.

Output: Static simplified version of the clinical note.

Implementation

NLP Approach

ClarifAI uses a **locally-hosted LLM** to simplify medical language to be more accessible.

Training & Evaluation

The model will be developed using **reinforcement learning**. Before patients are able to see their ClarifAI notes, **clinicians will review** and approve them.

Compute

May be **computationally expensive**, but will be **directly integrated** into the patient portal for easy access.

Security & Ethics

Standard security issues for sensitive health information apply. Clinicians will manually review for hallucinations.

How ClarifAI works?

Original pathology report:

“Specimen: multiple nodular masses from L masseteric region. Histology: encapsulated benign tumor, spindle cell pattern consistent w/ schwannoma. Conclusion: benign peripheral nerve sheath tumor.”

Simplified pathology report:

“The tissue samples from the left cheek/jaw area showed a non-cancerous tumor called a schwannoma. The tumor was well contained and had the typical appearance of a schwannoma.”
